                                                                                                                                                                                                                                                                                 /lab_host="E. Coli strain XLIO-Gold, Tl-resistant, F-"
/lab_host="E. Coli strain XLIO-Gold, Tl-resistant, F-"
/clone lib="Mouse lokb plasmid UUGCIM library"
/clone="Weetor: PWD42nv; Purifited genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarcse gel
electrophoresis. Vector DNA was prepared from a derivative
of pMD42 (gi|4732114|gb|AR129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XLIO-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20 bp mRNA linear BST 06-JUL-2004 DKFZp43402323 rl 434 (synonym: htes3) Homo sapiens cDNA clone AL063317 mRNA sequence.

Oligonuclectides which inhibit the expression of the ob-rgrp
protein and method for detection of compounds modifying the
protein and method for detection of the ob-rgrp family and the
interaction between the proteins of the ob-rgrp family and the
leptin receptor

                                                                                                                                                                                                                                                The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADB27653), that hybridises CC specifically with and inhibits the expression of ADB27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a manager of triethylemeglycol residue at the 3'-end. Also claimed are interfering RNA triethylemeglycol residue at the 3'-end. Also claimed are interfering RNA cryptesion of 15-2s nt that hybridize specifically with ADB27672, and inhibit (RNA) of 15-2s nt that hybridize specifically with ADB27672, and inhibit (RNB) of 18-2s nt that hybridize specifically with ADB27672, and inhibit coding sequences comprising OB-RGRP or NYO47 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP); and a protein that the OB-RGRP family, shares 68% homology with OB-RGRP, and a protein that protein (RTP) for detecting compounds that modify the interfering RNA, are the leptin receptor and OB-RGRP proteins, which can be used to prevent or the leptin and/or treatment of leptin-related disorders, e.g. cused for prevention and/or treatment of leptin-related disorders, e.g. calcification; obseity; diabetes; anorexia; disorders of sexual maturity, calcification; obseity; diabetes; anorexia; disorders of sexual maturity, and inflammation, fetal development and cancer. The present OB-RGRP and inflammation, fetal development and cancer. The present of immunity antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse; intermediate-conductance potassium channel, dermatological; antiinflammatory; keratolytic; vulnerary; antipsoriatic; atopic eczema; contact dermatitis; vitiligo; skin; hyperkeratosis; actinic keratose; hypertrophic scar; keloids; lentigo; aged skin; ulcer; psoriasis; mIKl;

                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel use of intermediate-conductance obcassium channel proteins. The proteins of the invention have decreated, antiinflammatory, keratelytic, vulnerary, and antipsoriatic activity. The method is used especially in the field of damaged skin, e.g. contact dermatitis, atopic eczema, vitiligo, hyperkeratosis, actinic keratosis, hypertrophic scars, keloids, lentigo, aged skin, ulcers and especially psoriasis. The sequence represents a PCR primer for the mouse potassium channel protein mIXI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pilC protein; pilin; pathogenic type 4 pilus bacteria; vaccine; detection; bacterial adhesin; phase variation; constant region; probe; Neisseria gonorrhoeae; Neisseria meningitidis; Pseudomonas aeruginosa;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                    use of intermediate-conductance potassium channel proteins for th diagnosis, prevention and treatment of disorders associated with disturbed keratinocyte activity, especially psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

```
of exons 1 to 27 and the promoter of the human retinoblastoms RB1 gene, used to amplify RB1 exons for use in a method of diagnosing mutations in the RB1 gene. By comparing the lengths of amplification products of RB exons from a suspected RB patient with those of RB wild-type DNA, patients can be diagnosed early which may avoid the need for radiotherapy. Any difference in length of exons between a suspected RB patient and those from wild-type RB1 indicates either a deletion or insertion mutation. Further sequencing of suspect exons can pinpoint the mutation. The method is directed to the diagnosis of and targeted genetic screening for retinoblastoma in family members of a retinoblastoma
             Sequences coding for pilin PilC proteins from Neisseria spp. have been isolated (see AAQ88239-Q88241). The pilC1 and pilC2 genes from N. gonorrhoeae have 84% identity. Probes were designed based on regions of shared homology (see AAQ88242-88261) and these constant region probes were used in Southern hybridisations to identify other pilC genes in N. gonorrhoeae strain MS11 and N. meningitidis strain A493. Also, the same probes were used to screen a Pseudomonas aeruginosa strain and identified a pilC-like sequence. Gene sequences which hybridise with any of the constant region probes are claimed. This sequence is a primer which was used in the amplification of the mouse KIAA0377 coding sequence. KIAA0377 is homologous to human BT42.

End contains the central signature of a histidine acid phosphatase, which are known to hydrolyze phosphate ester at low pH and are able to use a wide spectrum of substrates. The two BT42 isoforms of the customer of the mouse BT42. I hypercholesterolaemia of 40 amino acids compared to mouse BT42. Also BT42-II contains an additional exon of 40 amino acids.

ENT42 is regulated by fasting and by genetically induced obesity. BT42.

ENT42 is regulated by fasting and by genetically induced obesity. BT42.

ENT42 is regulated by fasting in any be used for the manufacture of an agent for detecting or/and verifying, for the treatment, alleviation and/or prevention of metabolic diseases or dysfunctions, including metabolic syndrome, obesity or/and diabetes, as well as related disorders such as caing disorder, cachexia, hypertension, coronary heart disease.

Compared to colling and phypeptical are useful for the hypercholesterolaemia, dyslipidemia, osteoarthritis, gallstones, or liver fibrosis, in cells, cell masses, organs and/or subjects in vivo or in control and metabolic syndrome for controlling the function of a gene or/and a medicament for the treatment of obesity, diabetes.

Cor/and metabolic syndrome for controlling the function of a gene or/and a gene product, which is influenced or/and modified by a BT42 homologous polypeptide, and for the production of a non-human correspond and any and any and any and and any an

NATI2839-T12899 (excluding AAT12878) are PCR primers used to amplify various regions of the RB-1 genome, including exons 1-27, the promoter region and a control sequence unrelated to RB-1 from chromosome 15. The primers are used in an example of a method for testing a disease-sascitated mutation in a gene, the gene may not necessarily be a tumour suppressor gene like the retinoblastoms gene another example is the expressor gene like the retinoblastoms gene another example is the be analysed using the same method. The primers are used in various groupings to produce a hierarchical assay useful to test a group of patients uspected to have a genetic mutation. The method allows the optimum (or near optimum) diagnostic algorithm by considering the cost and the sensitivity and specificity of each test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Untranslated region; coding sequence; chemotherapeutic drug treatment; antisense; modulation; multidrug resistance protein; drug; cancer; ss.

This primer and many other primers (see AATI1420-TI1473) are used to amplify RB1 exons for use in a method of diagnosing mutations in the RB1 gene. By comparing the lengths of amplification products of RB exons from a suspected RB patient with those of RB wild-type DNA, patients can be diagnosed early which may between a suspected RB patient and those from wild-type RB1 indicates between a suspected RB patient and those from wild-type RB1 indicates either a deletion or insertion mutation. Further sequencing of suspect exons an pinpoint the mutation. The method is directed to the diagnosis of and targeted genetic screening for retinoblastoma in family members of a retinoblastoma patient

This is the nucleotide sequence of the phosphorothioate oligonucleotide used in the method of the invention, involving the used of antisense oligonucleotides to inhibit multidung resistance. The oligonucleotides are used for the antisense inhibition of multiresistant proteins (RRPB). These proteins are commonly found in some cancers which initially respond to chemcherapy, but overexpression of the protein leads to chemcherapy drug resistance. They are administered with the drugs to attempt to and as such, the oligonucleotides can be used to treat these conditions as well. The sequences are based on the human MRP and are used to treat conditions such as cancers, especially small-cell lung cancer, prevention of development of multidrug resistance during chemotherapy, and treatment of conditions characterised by leukotriene production, especially inflammatory conditions. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analyzing multiple targets in polynucleotide, by providing multiple primers with target nucleic acids, digesting nucleic acid products with cognate restriction enzymes, amplifying digested products, and detecting
                                                                                                                                                            Anti:sense oligo:nucleotide(s) inhibiting multi:drug resistance protein expression - useful for increasing the efficacy of drugs that certain conditions have become resistant to e.g. small cell lung cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotides AAQ86826-50 are antisense oligonucleotides used to modulate the expression of the multidrug resistance protein (MRP) by hybridising with the multidrug resistance (MDR) gene or its RNA message. This sequence is targeted to the 3' untranslated region (3'UTR) of the MDR gene. The oligonucleotides can be used to improve the efficacy of chemotherapeutic drug treatment of a disease such as cancer or to prevent multidrug resistance developing during drug treatment of a disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phosphorothioate oligonucleotide; antisense; inhibition; cancer; multidrug resistance; multiresistant protein; MRP; chemotherapy; human; leukotriene; inflammatory condition; ss.

The invention relates analysing multiple targets in polymucleotide, convolves providing a set or sets of multiple primers with target nucleic acids in separate reactions of primer extension or amplification, where the reactions produce nucleic acid products in that each nucleic acid tragments comprise at least one restriction sites with cognate products of the separate reactions on the restriction sites with cognate creations together, where randomly joining nucleic acid fragments from the separated reactions are created, amplifying the joined products, and the separated reactions are created, amplifying the joined products, and creations together, where randomly joining nucleic acid fragments from the separated reactions are created, amplifying the joined products, and complementary portion and 5' non-complementary portion, where the fromplementary portion and 5' non-complementary portion, where the complementary portion comprises a restriction enzyme site, where the complementary portion or comprises a restriction site, where the compression site acts as detection marker in the process of detecting target nucleic acid sequence, where the detection product is capter nucleic acid sequence, where the detection product is nated to the presence of target nucleic acid sequence, as as eat or sets of multiple targets in a polymucleotide and detection of multiple targets in a polymucleotide and for genoryping mutations, preferably single creaticition enzymes, DNA ligase, DNA polymerase, ddArrp, buffers for all enzymes, and dNTP9). The method is useful for analysing multiple expectation cargets from any source. The method is useful for analysing multiple expectation cargets guantitatively. An experiment was performed, using the method of the invention, where SNPs were detected in 70 human genomic DNA cargets and the invention, where SNPs were detected in 70 human genomic in the present sequence is a primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; 88; Ulip; CRMP; collapsin response mediator protein; PCR; Unc.13-like protein; neurodegenerative disease; Alzheimer's disease; paraneoplastic neurodegenerative disease; PND; myellination; demyellination; myelin disorder; multiple sclerosis; autoimmune neurodegenerative disorder; HTLV-1 associated myelopathy; human T lymphocyte virus 1; reverse transcriptase PCR; primer; glial fibrillary associated protein; GFAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human glial fibrillary associated protein, GFAP, RT-PCR primer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ch

The invention relates to a new method for prevention or treatment of myelin disorders, comprises administering to a patient an effective myelin disorders, comprises administering to a patient an effective amount of an agent selected from a Ulip (Unc-33-1ke protein/CRMP) can administering a nucleic acid, an antisense sequence capable of specifically hybridising with Ulip/CRMP, and antisense tup/CRMP, or an aptamer cologically acceptable carrier. C capable of binding ULIP/CRMP, and a pharmacologically acceptable carrier. Also included are methods of diagnosing a myelin disorder in a subject, disorders, using the Ulip/CRMP proteins/nucleic acids, agents capable of disorders, using the Ulip/CRMP proteins/nucleic acids, agents capable of c disorders, using the Ulip/CRMP proteins or the reatment of myelin decreasing), and a method for identifying an endogenous agent as a cofisorders. The agents are useful for preventing or treatment of myelin colisorder such as multiple sclerosis or HTLV-1 (human T lymphocyte virus is secondated myelopathy and neurodegenerative diseases (PND), autoimmune c diseases parametollastic neurodegenerative diseases (PND), autoimmune c unip/CRMP proteins are involved in neurodegenerative diseases (PND), autoimmune c ulip/CRMP proteins are involved in neurodegenerative diseases (PND), autoimmune c ulip/CRMP proteins are involved in neurodegenerative diseases (PND), autoimmune c to a ulip/CRMP protein are useful for diagnosing a myelin disorder. The present sequence is a reverse transcriptase (RT)-PCR primer for glial c present sequence is a reverse transcriptase (RT)-PCR primer for glial
                                                                                                                                                                                                         Prevention or treatment of myelin disorders, such as multiple sclerosis, by administering an agent selected from a Ulip/CRMP protein, a nucleic acid coding for the protein, or an antibody directed against protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; GB virus B; GBV-B; HCV; flavivirus; hepatitis C virus; antiviral; vaccine; virucidal; antiinflammatory; PCR; primer; NS5A.

The invention describes a new isolated polynucleotide (I) encoding a 3' sequence of the GB virus B (GBV-B) genome, or which comprises a chimeric GBV-B genome, where at least part, but not all of a 5' nontranslated region (NTR) sequence is derived from a hepatitis C virus (HCV) 5' NTR. (I) is a GB virus B and/or hepatitis C virus polynucleotide comprising a fully defined of 260 or 9199 bp (SEQ ID NOS: 1 or 2). The polynucleotides or chimaeras are useful diagnosing or treating hepatitis C virus (HCV) and in investigating the mechanisms for the different biological and in investigating the viruses. This sequence represents a primer used to detect a chimeric virus comprising domain III of the 5'NTR of HCV (IRES) within a genetic background of GBV-B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                            New GB virus B and/or hepatitis C virus (HCV) sequences, useful in diagnosing and in treating HCV and in investigating the mechanisms for the different biological properties of the viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human; single nucleotide polymorphism; SNP; ss; primer.

                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel isolated chimeric GB virus B (GBV-B)/HCV polynucleotides. Specifically, it refers to using the hepatotropic flavivius GBV-B that has a unique phylogenetic relationship to the human hepatitis C virus (HCV) and can serve as a surrogate virus in drug discovery efforts related to antiviral drug development. The present is using the newly determined 3' terminal sequence of GBV-B. Furthermore, the GBV-B/HCV chimeras exhibit liver-specific expression and express HCV envelope proteins such that they can have utility as a vaccine immunogen for the ABV-B/HCV chimeras exhibit liver-specific expression and express HCV envelope proteins such that they can have utility as a vaccine immunogen of for hepatitis C. In addition, they can be used for screening compounds active against viral infection, as well as for developing HCV preventative and therapeutic treatments. Accordingly, these compositions exhibit virucidal, antiinflammatory and hepatotropic activities. This coligonucleotide sequence is a PCR primer used to amplify the GBV-B NSSA gene sequence of the invention. NOTE: This sequence is given as SeqID 16 in the sequence listing but is referred to as SeqID 15 in example 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, sequences of 20 base pairs, given in the specification. The compound composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disporder, is chemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.

19. 916A-13

19. 5equence 13. Application US/08779916A

19. Sequence 13. Application US/08779916A

19. Patent No. 6063567.

10. GENERAL INFORMATION:

APPLICANT: Gallie, Brenda L.

APPLICANT: Gallie, Brenda L.

APPLICANT: Hui, May

TITLE OF INVENTION: Method, Reagents and Kit for Diagnosis

TITLE OF INVENTION: Method, Reagents and Kit for Diagnosis

TITLE OF INVENTION: and Targeted Screening for Retinoblastoma

NUMBER OF SEQUENCES: 123

CORRESPONDENCE ADDRESS:

ADDRESSEE: Oppedable & Larson

STREET: 1992 Commerce Street, Suite 309

CITY: Yorktown Heights
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

i Sequence 7, Application US/09275680

patent No. 6221630

GENERAL INFORMATION:

APPLICANT: HOpper, James E

TITLE OF INVENTION: Regulated High-level Production of Polypeptides in

TITLE OF INVENTION: Yeast

PITLE OF INVENTION: Yeast

TITLE OF INVENTION: Yeast

PITLE OF INVENTION: US/09/275,680

CURRENT APPLICATION UNMER: US/09/275,680

CURRENT PAPLICATION UNMER: 1999-03-24

NUMBER OF SEQ ID NOS: 22

SOFTWARE: PatentIn Ver. 2.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 39, Application US/09366257

Patent No. 6030837

GENERAL INFORMATION:

APPLICANT: Robert McKay

APPLICANT: Lex M. Cowsert

TITLE OF INVENTION: ANTIENSE MODULATION OF PEPCK-MITOCHONDRIAL EXPRESSION

TITLE OF INVENTION: ANTIENSE MODULATION OF PEPCK-MITOCHONDRIAL EXPRESSION

TURENT APPLICATION NUMBER: US/09/366,257

CURRENT PILING DATE: 1999-08-03

NUMBER OF SEQ ID NOS: 47

LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                             Gaps

GENERAL INFORMATION:

APPLICANT: JOCKERS, Ralf
APPLICANT: COUTURIER, Cyril
APPLICANT: ULHMANN, Eugen
TITLE OF INVENTION: Oliquocoleotides Which inhibit Expression of the OB-RGRP Protein
TITLE OF INVENTION: And Method For Detecting Compounds Which Modify The Interaction
TITLE OF INVENTION: Between Proteins Of the OB-RGRP Family And The Leptin Receptor
FILE REFERENCE: FRAVZO03/0005 US NP
CURRENT APPLICATION NUMBER: US/10/774,721
CURRENT FILING DATE: 2004-02-09

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: JOCKERS, Raif

APPLICANT: COUTURIER, Cyril
APPLICANT: UHLANIN, Eugen
TITLE OF INVENTION: Olignoclectides Which inhibit Expression of the OB-RGRP Frotein
TITLE OF INVENTION: And Method For Detecting Compounds Which Modify The Interaction
TITLE OF INVENTION: Between Proteins Of the OB-RGRP Family And The Leptin Receptor
FILE REFERENCE: FRAV2003/0005 US NP
CURRENT FILING DATE: 2004-02-09
FRIOR PAPLICATION NUMBER: 60/461,005
FRIOR PLING DATE: 2003-04-07
